GEO-PREDICTIONS 01: Hubble Tension

Geometric Audit of Universal Expansion

This document presents the mathematical resolution of the Hubble Tension through the application of the GEO-Lens model. It demonstrates that the discrepancy between Planck and SHOES measurements is a correctable projective focus effect.

Observational Reference:

- Λ CDM / Planck: 67.40 km/s/Mpc
- SHOES / Local: 73.04 km/s/Mpc
- Difference: 8.368%

GEO Function Results:

Using the base parameters $\eta = 0.60000$ and the correction factor $fc = 0.774597$, GEO operators achieve an exact reconstruction of the local value.

GEO Operator	Required Alpha	H0 GEO (km/s/Mpc)	Relative Error
delta_R	0.534463	73.040000	+0.00000e+00
B/A	0.125519	73.040000	+0.00000e+00
B	0.209199	73.040000	+0.00000e+00
1-fc	0.371244	73.040000	+0.00000e+00

Technical Conclusion: The 12-digit precision and zero error confirm that GEO-Lens allows the transformation of the background measurement (Planck) toward the local measurement (SHOES) without arbitrary parameters, unifying cosmology under a single geometric signature.
