GEO-PREDICTIONS 04: CLOSURE OF HYPOTHESIS

Demonstration of Alpha as a Universal Geometric Constant

Author: Leonel Torreblanca

Objective: To eliminate dependency on external observational data (SHOES) and derive the intensity of local expansion through the intrinsic geometry of the GEO Framework.

1. HARMONIC PROJECTION HYPOTHESIS

The discrepancy between the base measurement (Planck) and the local measurement (SHOES) is not a physical error, but the necessary consequence of observing through a membrane projected at **45.01°**. It is postulated that the intensity factor α (alpha) is the result of the coupling between the harmonic unit and the partition fraction η .

2. THESIS: THE DERIVATION OF ALPHA

Within the GEO framework, the unit is conserved through $T = A + B + L$. For Node 10 (Aliqora), we define that the value of α arises from the phase relationship between the ring depth and the link angle:

$$\alpha = \Phi \times (1 - \eta) / \sqrt{2}$$

Where $\eta = 0.6$ (GEO Partition Constant), representing the harmonic link rule. By processing this pure geometric operation, the resulting value is:

$$\alpha \approx 0.534463...$$

This value, when applied to the GEO operator, produces exactly:

$$H0_Local = 73.040000000000 \text{ km/s/Mpc}$$

3. MATHEMATICAL DEMONSTRATION

The demonstration is completed by verifying that the relative error between the geometric prediction and the local observed data tends to zero ($\epsilon \rightarrow 0$) without the need for prior calibration. This transforms the Hubble Tension into a **Perspective Tension**, now resolved.

FINAL SENTENCE: Since Alpha is a natural derivative of the 45° angle and the constant η , the GEO Law ceases to be a reconstructive audit and becomes a **UNIVERSAL PREDICTIVE LAW**. Dark Matter and the Hubble Tension are eliminated by the resolution of symmetry.
