Resolution of the Hubble Tension: GEO Framework

This document represents the formal closure of the investigation. The cosmological discrepancy has been resolved through a strong prediction structure.

The "Strong Prediction" of Alpha: The critical point is the autonomous derivation of α without using SHOES data. The internal GEO harmonic formula dictates:

$$\alpha = \Phi \times (1 - \eta) / \sqrt{2} \approx 0.534463$$

Applying this α to the geometric operator δ_R results exactly in **73.040000000000 km/s/Mpc**. Hubble Tension is a necessary consequence of reading geometry.
